# 2.1 — Random Variables & Distributions ECON 480 • Econometrics • Fall 2021 Ryan Safner Assistant Professor of Economics ✓ safner@hood.edu ○ ryansafner/metricsF21 ⓒ metricsF21.classes.ryansafner.com

# **Random Variables**

#### Experiments

 An experiment is any procedure that can (in principle) be repeated infinitely and has a well-defined set of outcomes

**Example**: flip a coin 10 times

#### **Random Variables**

- A random variable (RV) takes on values that are unknown in advance, but determined by an experiment
- A numerical summary of a random outcome

**Example**: the number of heads from 10 coin flips

#### **Random Variables: Notation**

- Random variable X takes on individual values  $(x_i)$  from a set of possible values
- Often capital letters to denote RV's
  - $\circ~$  lowercase letters for individual values

**Example**: Let X be the number of Heads from 10 coin flips.  $x_i \in \{0, 1, 2, \dots, 10\}$ 

## **Discrete Random Variables**

#### **Discrete Random Variables**

• A **discrete random variable**: takes on a finite/countable set of possible values

**Example**: Let X be the number of times your computer crashes this semester<sup>1</sup>,  $x_i \in \{0, 1, 2, 3, 4\}$ 

<sup>1</sup> Please, back up your files!

#### **Discrete Random Variables: Probability Distribution**

• **Probability distribution** of a R.V. fully lists all the possible values of *X* and their associated probabilities Example:

$$x_i \ P(X = x_i)$$

0.00
------

- 2 0.06
- 3 0.03
- 4 0.01

#### Discrete Random Variables: pdf

**Probability distribution function (pdf)** summarizes the possible outcomes of X and their probabilities

• Notation:  $f_X$  is the pdf of X:

 $f_X = p_i, \quad i = 1, 2, \dots, k$ 

- For any real number  $x_i$ ,  $f(x_i)$  is the probablity that  $X = x_i$
- What is f(0)?
- What is f(3)?

#### Example:

$x_i$	$P(X = x_i)$
0	0.80
1	0.10
2	0.06
3	0.03
4	0.01

#### **Discrete Random Variables: pdf Graph**

#### Discrete Random Variables: cdf

**Cumulative distribution function (pdf)** lists probability X will be *at most* (less than or equal to) a given value  $x_i$ 

• Notation:  $F_X = P(X \le x_i)$ 

#### **Example**:

$X_i$	f(x)	F(x)
0	0.80	0.80
1	0.10	0.90
2	0.06	0.96
3	0.03	0.99
4	0.01	1.00

- What is the probability your computer will crash *at most* once, F(1)?
- What about three times, F(3)?

#### **Discrete Random Variables: cdf Graph**

crashes<-crashes %>% mutate(cum prob = cumsum(prob)) crashes ## # A tibble: 5 × 3 number prob cum prob ## <dbl> <dbl> <dbl> ## 0 0.8 ## 1 0.8 ## 2 1 0.1 0.9 2 0.06 0.96 ## 3 3 0.03 0.99 ## 4 ## 5 4 0.01 1 ggplot(data = crashes)+ aes(x = number,y = cum prob) +geom col(fill="#0072B2")+ labs(x = "Number of Crashes", y = "Probability")+

# **Expected Value and Variance**

#### **Expected Value of a Random Variable**

• Expected value of a random variable X, written E(X) (and sometimes  $\mu$ ), is the long-run average value of X "expected" after many repetitions

$$E(X) = \sum_{i=1}^{k} p_i x_i$$

- $E(X) = p_1 x_1 + p_2 x_2 + \dots + p_k x_k$
- A **probability-weighted average** of X, with each  $x_i$  weighted by its associated probability  $p_i$
- Also called the "mean" or "expectation" of X, always denoted either E(X) or  $\mu_X$

#### **Expected Value: Example I**

**Example**: Suppose you lend your friend \$100 at 10% interest. If the loan is repaid, you receive \$110. You estimate that your friend is 99% likely to repay, but there is a default risk of 1% where you get nothing. What is the expected value of repayment?

#### **Expected Value: Example II**

#### Example:

Let X be a random variable that is described by the following pdf:

$$x_i$$
 $P(X = x_i)$ 10.5020.2530.1540.10

Calculate E(X).

#### The Steps to Calculate E(X), Coded

X %>%

```
summarize(expected_value = sum(x_i*p_i))
```

## # A tibble: 1 × 1
## expected\_value
## <dbl>
## 1 1.85

#### Variance of a Random Variable

• The variance of a random variable X, denoted var(X) or  $\sigma_X^2$  is:

$$\sigma_X^2 = E[(x_i - \mu_X)^2] = \sum_{i=1}^n (x_i - \mu_X)^2 p_i$$

- This is the expected value of the squared deviations from the mean
  - $\circ~$  i.e. the probability-weighted average of the squared deviations

#### **Standard Deviation of a Random Variable**

• The standard deviation of a random variable X, denoted sd(X) or  $\sigma_X$  is:

$$\sigma_X = \sqrt{\sigma_X^2}$$

#### **Standard Deviation: Example I**

**Example**: What is the standard deviation of computer crashes?

$$x_i P(X = x_i)$$

0 0.80

1 0.10

2 0.06

3 0.03

4 0.01

#### The Steps to Calculate sd(X), Coded I

```
# get the expected value
crashes %>%
  summarize(expected_value = sum(number*prob))
```

#### The Steps to Calculate sd(X), Coded II

# look at what we made
crashes\_2

#### ## # A tibble: 5 × 5

##		number	prob	deviations	deviations_sq	weighted_devs_sq
##		<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>
##	1	0	0.8	-0.35	0.122	0.098
##	2	1	0.1	0.65	0.423	0.0423
##	3	2	0.06	1.65	2.72	0.163
##	4	3	0.03	2.65	7.02	0.211
##	5	4	0.01	3.65	13.3	0.133

#### The Steps to Calculate sd(X), Coded III

```
# now we want to take the expected value of the squared deviations to get variance
crashes_2 %>%
summarize(variance = sum(weighted_devs_sq), # variance
sd = sqrt(variance)) # sd is square root
```

```
## # A tibble: 1 × 2
## variance sd
## <dbl> <dbl>
## 1 0.648 0.805
```

#### **Standard Deviation: Example II**

**Example**: What is the standard deviation of the random variable we saw before?

$x_i$	$P(X = x_i)$
1	0.50
2	0.25
3	0.15
4	0.10

Hint: you already found it's expected value.

# **Continuous Random Variables**

#### **Continuous Random Variables**

- **Continuous random variables** can take on an uncountable (infinite) number of values
- So many values that the probability of any specific value is infinitely small:

 $P(X = x_i) \to 0$ 

• Instead, we focus on a *range* of values it might take on

#### Continuous Random Variables: pdf I

# **Probability** *density* **function (pdf)** of a continuous variable represents the probability between two values as the area under a curve

- The total area under the curve is 1
- Since P(a) = 0 and P(b) = 0,  $P(a < X < b) = P(a \le X \le b)$

#### **Continuous Random Variables: pdf II**

• FYI using calculus:

1

$$P(a \le X \le b) = \int_{a}^{b} f(x)dx$$

• Complicated: software or (old fashioned!) probability tables to calculate

#### **Continuous Random Variables: cdf I**

• The cumulative density function (cdf) describes the area under the pdf for all values less than or equal to (i.e. to the left of) a given value, k

$$P(X \le k)$$

**Example**:  $P(X \le 2)$ 

#### **Continuous Random Variables: cdf II**

 Note: to find the probability of values greater than or equal to (to the right of) a given value k:

 $P(X \ge k) = 1 - P(X \le k)$ 

**Example**:  $P(X \ge 2) = 1 - P(X \le 2)$ 

 $P(X \ge 2)$  = area under the curve to the right of 2

# **The Normal Distribution**

#### **The Normal Distribution I**

• The Gaussian or normal distribution is the most useful type of probability distribution

 $X \sim N(\mu, \sigma)$ 

- Continuous, symmetric, unimodal, with mean  $\mu$  and standard deviation  $\sigma$ 

#### **The Normal Distribution II**

- FYI: The pdf of  $X \sim N(\mu,\sigma)$  is

$$P(X=k) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{1}{2}\left(\frac{(k-\mu)}{\sigma}\right)^2}$$

• **Do not try and learn this**, we have software and (previously tables) to calculate pdfs and cdfs

• **68-95-99.7% empirical rule**: for a normal distribution:

- **68-95-99.7% empirical rule**: for a normal distribution:
- $P(\mu 1\sigma \le X \le \mu + 1\sigma) \approx 68\%$

- **68-95-99.7% empirical rule**: for a normal distribution:
- $P(\mu 1\sigma \le X \le \mu + 1\sigma) \approx 68\%$
- $P(\mu 2\sigma \le X \le \mu + 2\sigma) \approx$  95%

- **68-95-99.7% empirical rule**: for a normal distribution:
- $P(\mu 1\sigma \le X \le \mu + 1\sigma) \approx 68\%$
- $P(\mu 2\sigma \le X \le \mu + 2\sigma) \approx$  95%
- $P(\mu 3\sigma \le X \le \mu + 3\sigma) \approx 99.7\%$
- 68/95/99.7% of observations fall within
   1/2/3 standard deviations of the mean

#### **The Standard Normal Distribution**

The standard normal distribution (often referred to as Z) has mean 0 and standard deviation 1

 $Z \sim N(0, 1)$ 

#### **The Standard Normal cdf**

• The **standard** normal cdf

 $\Phi(k) = P(Z \le k)$ 

#### **Standardizing Variables**

We can take any normal distribution (for any μ, σ) and standardize it to the standard normal distribution by taking the Z-score of any value, x<sub>i</sub>:

$$Z = \frac{x_i - \mu}{\sigma}$$

- Subtract any value by the distribution's mean and divide by standard deviation
- Z: number of standard deviations  $x_i$  value is away from the mean

#### **Standardizing Variables: Example**

**Example**: On August 8, 2011, the Dow dropped 634.8 points, sending shock waves through the financial community. Assume that during mid-2011 to mid-2012 the daily change for the Dow is normally distributed, with the mean daily change of 1.87 points and a standard deviation of 155.28 points. What is the *Z*-score?

$$Z = \frac{X - \mu}{\sigma}$$
$$Z = \frac{634.8 - 1.87}{155.28}$$
$$Z = -4.1$$

This is 4.1 standard deviations ( $\sigma$ ) beneath the mean, an *extremely* low probability event.

#### Standardizing Variables: From X to Z I

**Example**: In the last quarter of 2015, a group of 64 mutual funds had a mean return of 2.4% with a standard deviation of 5.6%. These returns can be approximated by a normal distribution.

What percent of the funds would you expect to be earning between -3.2% and 8.0% returns?

Convert to standard normal to find Z-scores for 8 and -3.2.

P(-3.2 < X < 8)  $P(\frac{-3.2 - 2.4}{5.6} < \frac{X - 2.4}{5.6} < \frac{8 - 2.4}{5.6})$  P(-1 < Z < 1)  $P(X \pm 1\sigma) = 0.68$ 

#### Standardizing Variables: From X to Z II

#### Standardizing Variables: From X to Z III

**You Try**: In the last quarter of 2015, a group of 64 mutual funds had a mean return of 2.4% with a standard deviation of 5.6%. These returns can be approximated by a normal distribution.

- 1. What percent of the funds would you expect to be earning between -3.2% and 8.0% returns?
- 2. What percent of the funds would you expect to be earning 2.4% or less?
- 3. What percent of the funds would you expect to be earning between -8.8% and 13.6%?
- 4. What percent of the funds would you expect to be earning returns greater than 13.6%?

#### **Finding Z-score Probabilities I**

• How do we actually find the probabilities for Z-scores?

Table of Standard Normal Probabilities for Negative Z-scores

0.01 0.02 0.07 0.08 0.09 0.00 0.03 0.04 0.05 0.06 Z -3.4 0.0003 0.0003 0.0003 0.0003 0.0003 0.0003 0.0003 0.0003 0.0003 0.0002 -3.3 0.0005 0.0005 0.0005 0.0004 0.0004 0.0004 0.0004 0.0004 0.0004 0.0003 0.0006 0.0006 0.0005 -3.2 0.0007 0.0007 0.0006 0.0006 0.0006 0.0005 0.0005 -3.1 0.0009 0.0009 0.0009 0.0008 0.0008 0.0008 0.0008 0.0010 0.0007 0.0007 -3.0 0.0013 0.0013 0.0013 0.0012 0.0012 0.0011 0.0011 0.001 0.0010 0.0010 -2.9 0.0018 0.0016 0.0019 0.0018 0.0017 0.0016 0.0015 0.0015 0.0014 0.0014 0.0025 0.0024 0.0023 0.0023 0.0022 0.0021 0.002 -2.8 0.0026 0.0020 0.0019 -2.7 0.0035 0.0034 0.0033 0.0032 0.0031 0.0030 0.0029 0.0028 0.0027 0.0026 -2.6 0.0047 0.0045 0.0044 0.0043 0.0041 0.0040 0.0039 0.0038 0.0037 0.0036 -2.5 0.0060 0.0059 0.0054 0.0062 0.0057 0.0055 0.0052 0.0051 0.0049 0.0048 -2.4 0.0082 0.0078 0.0075 0.0073 0.0071 0.0069 0.0068 0.0080 0.0066 0.0064 -2.3 0.0107 0.0104 0.0102 0.0099 0.0096 0.0094 0.0091 0.0089 0.0087 0.0084 -2.2 0.0139 0.0136 0.0132 0.0129 0.0125 0.0122 0.0119 0.0116 0.0113 0.0110 -2.1 0.0179 0.0174 0.0170 0.0166 0.0162 0.0158 0.0154 0.0150 0.0146 0.0143 -2.0 0.0228 0.0222 0.0217 0.0212 0.0207 0.0202 0.0197 0.0192 0.0188 0.0183 -1.9 0.0274 0.0287 0.0281 0.0268 0.0262 0.0256 0.0250 0.0244 0.0239 0.0233 -1.8 0.0359 0.0351 0.0344 0.0336 0.0329 0.0322 0.0314 0.0307 0.0301 0.0294

#### Table of Standard Normal Probabilities for Positive Z-scores

#### Finding Z-score Probabilities II

Probability to the **left** of  $z_i$ 

$$P(Z \le z_i) = \underbrace{\Phi(z_i)}_{\text{cdf of } z_i}$$

Probability to the **right** of  $z_i$ 

$$P(Z \ge z_i) = 1 - \underbrace{\Phi(z_i)}_{\text{cdf of } z_i}$$

#### Finding Z-score Probabilities III

Probability **between**  $z_1$  and  $z_2$ 

## Finding Z-score Probabilities IV

- pnorm() calculates p robabilities with
   a norm al distribution with arguments:
  - mean = the mean
  - sd = the standard deviation
  - o lower.tail =
    - TRUE if looking at area to *LEFT* of value
    - FALSE if looking at area to *RIGHT* of value

#### **Finding Z-score Probabilities IV**

**Example**: Let the distribution of grades be normal, with mean 75 and standard deviation 10.

• Probability a student gets **at least an 80** 

```
pnorm(80,
    mean = 75,
    sd = 10,
    lower.tail = FALSE) # looking to right
```

## [1] 0.3085375

#### **Finding Z-score Probabilities V**

**Example**: Let the distribution of grades be normal, with mean 75 and standard deviation 10.

• Probability a student gets **at most an 80** 

```
pnorm(80,
    mean = 75,
    sd = 10,
    lower.tail = TRUE) # looking to left
```

## [1] 0.6914625

#### Finding Z-score Probabilities VI

**Example**: Let the distribution of grades be normal, with mean 75 and standard deviation 10.

• Probability a student gets **between a 65 and 85** 

```
# subtract two left tails!
pnorm(85, # larger number first!
    mean = 75,
    sd = 10,
    lower.tail = TRUE) - # looking to left, & SUBTRACT
pnorm(65, # smaller number second!
    mean = 75,
    sd = 10,
    lower.tail = TRUE) #looking to left
```
